

Requirements Validation Against CleanTasker Fit

MIT ACT — Crennotech Group Project (Smart Document Scan AI) · Week 3 · 8 August 2026

Purpose

Before moving into system design (Week 4), we checked that everything in our Data-Extraction Field List and Functional/Non-Functional Requirements actually lines up with how CleanTasker works and what the project brief asked for.

What we checked

Check	Result
Do our extraction fields match the brief's list (client, site, address, building type, areas, tasks, frequencies, periodic services, special notes, consumables, compliance notes, site settings)?	Yes — all fields covered
Do our supported import formats match the brief (PDF, Word, Excel, email, image-based/scanned PDF)?	Yes — all formats covered
Does our review-and-edit requirement (FR7) support the brief's expected UI actions (move tasks, rename areas/tasks, edit frequencies, merge duplicate areas, add missing tasks, create new areas)?	Partially — covered at a high level; specific UI actions to be detailed in Week 5 UI prototype
Does our confidence-scoring approach fit how CleanTasker already flags items needing review?	Yes, based on team discussion — to be confirmed with Kiran
Does our proposed data output match what CleanTasker's API would need for import (client, site, areas, task templates, frequencies, periodical jobs, inspection templates)?	Mostly — exact API field names still need confirming with Crennotech

Gaps identified

- UI actions (move/rename/merge/create) need to be broken into individual functional requirements before Week 5 prototype work.
- Exact CleanTasker API field names are not yet confirmed — raised as an open question for our client meeting.

Conclusion

Our Week 3 requirements are a good fit for CleanTasker's needs overall. Two gaps were identified and added to our open questions list ahead of the Week 4 architecture design.
