

Business Requirements Document

MIT ACT — Crennotech Group Project (Smart Document Scan AI) · Week 2 · 1 August 2026

Purpose

This document lists what the business (Crennotech / CleanTasker) needs from this project, in plain terms, based on the project charter and our SOW analysis this week.

Business Problem

CleanTasker has no structured way to take in Scope of Work (SOW) documents. Staff currently set up each new client by hand, reading through PDFs, Word docs, Excel sheets and sometimes scanned documents. This is slow and easy to get wrong.

Business Requirements

ID	Requirement	Why it matters
BR1	Accept SOW documents in PDF, Word, Excel, scanned/image, and email form	Customers send documents in whatever format they already use
BR2	Pull out client, site, address, building type, areas, tasks, frequencies, consumables and compliance notes	These are the fields CleanTasker needs to set up a client
BR3	Handle different wording/layouts between customers without needing a new setup each time	Our SOW analysis showed real inconsistency between customers
BR4	Show a confidence level for each extracted field	So staff know what to double-check before saving it
BR5	Let staff review and correct extracted data before it's saved into CleanTasker	Mistakes in automatic extraction need a human check

Out of scope for this project

- Actually building/coding the finished AI engine (that's a later, Semester 2 activity)
- Connecting live to Crennotech's real customer data
- Any CleanTasker features unrelated to SOW import (e.g. payroll, invoicing)
