

SOW Sample Analysis

MIT ACT — Crennotech Group Project (Smart Document Scan AI) · Week 2 · 29 July 2026

What we did

We looked at real-world Scope of Work (SOW) documents to see how they are laid out, so we understand what CleanTasker needs to be able to read automatically.

Formats we found

Format	How common	Notes
PDF (text-based)	Most common	Easiest to read automatically — text can be extracted directly
Word (.docx)	Common	Structure varies a lot between customers
Excel (.xlsx)	Common for task lists	Good for frequencies/tasks, but layout differs per client
Scanned / image PDF	Occasional	Needs OCR (image-to-text) before anything else can happen
Email body / attachments	Occasional	Sometimes the SOW is just written in the email, not a separate file

Fields we usually see

- Client name and site address
- Building type (office, retail, warehouse, etc.)
- Areas to clean (lobby, kitchen, restrooms, etc.)
- Cleaning tasks and how often they happen (daily, weekly, monthly)
- Consumables needed (soap, bin liners, etc.)
- Compliance notes (safety rules, access requirements)

Inconsistencies between customers

- Some SOWs group tasks by room, others by task type across the whole site
- Frequency is sometimes a word ("daily") and sometimes a number ("5x/week")
- Some documents separate consumables into their own section, others mix them into the task list
- Naming for the same thing varies ("periodic services" vs "deep clean" vs "quarterly tasks")

What this means for us

Because formats and terminology are inconsistent, our extraction design (Week 3–4) will need to map different customer wording onto one standard set of fields, rather than assuming every SOW looks the same.
