

Confidence-Scoring Rules

MIT ACT — Crennotech Group Project (Smart Document Scan AI) · Week 3 · Individual task · 8 August 2026

Why we need this

Not every extracted field will be equally reliable. A confidence score tells staff which fields to trust and which ones to double-check before saving into CleanTasker.

Proposed scoring rules

Confidence level	What it means	What staff should do
High (90%+)	Field matched a clear, expected pattern (e.g. a labelled address field)	Quick visual check only
Medium (60–89%)	Field was found but format or wording was unusual	Review before saving
Low (below 60%)	Field was guessed, missing, or came from a low-quality scan	Must be manually checked/corrected

What affects the score

- How closely the source text matches expected wording for that field
- Whether the field came from clean text vs. a scanned/OCR'd image
- Whether the value was found in an expected location (e.g. near "Client:" label) or inferred from context

Validated against CleanTasker fit

Checked with the team that these scoring levels line up with how CleanTasker already flags fields needing review, so the extracted data doesn't need a second, separate review process.
